Excerpt: . . . instability is caused by the numerator of the ratio beginning at 4. 5 ft as trees grow past the dbh threshold, while the denominator begins at zero. For this reason, we restricted analyses of H D ratios to trees 8 ft tall at the time of thinning. D ratios for sample trees varied from 60. 5 for the 14x14 spacing to 69. 6 Mean H 0 0 for the 5x5 spacing (Table 6). At narrow spacings, crews left higher numbers of slender trees (higher H D ratios), but as spacing increased, the proportion of trees with lower 0 0 ratios increased. This is a reasonable result because crews were instructed to leave the best available trees at the approximate spacing for the experimental unit. As spacing decreases, a higher proportion of poor trees must be left to obtain the desired spacing. Table 6(H D) and yr 5 (H D) by spacing (ft). Means 0 0 5 5 followed by the same letter are not statistically different at the P 0. 05 level. Spacing Year Mean Std. Dev.
